# WINDOW WELL COVER SIZING

## MEASUREMENT GUIDE:

Take following four measurements of your window well to ensure you select the best fitting cover. Covers are designed to be up 2" larger than your window well. Custom covers are available if your well does not match with a stock sized cover.

**Length (L):** The opening of your window well where it is connected to the house. Measure from outside edge to outside edge, but do not include the attachment flanges.

**Projection (P):** The distance from the basement wall to outside of the window well. Measure at the middle of the window well.

**Front Length (LF):** The length of the flat section between the two corners at the front of the window well. Do not included the radius of the corners. For square window wells this dimension will be the same as the Length.

**Middle Length (MF):** The opening of the window well measured 9" back from the front edge of the well. Not required for square window wells.

--- Window Well Cover

**NOTE:** Window well covers are made 2" larger than window wells to allow for some overlap.
