RADIANT HEAT

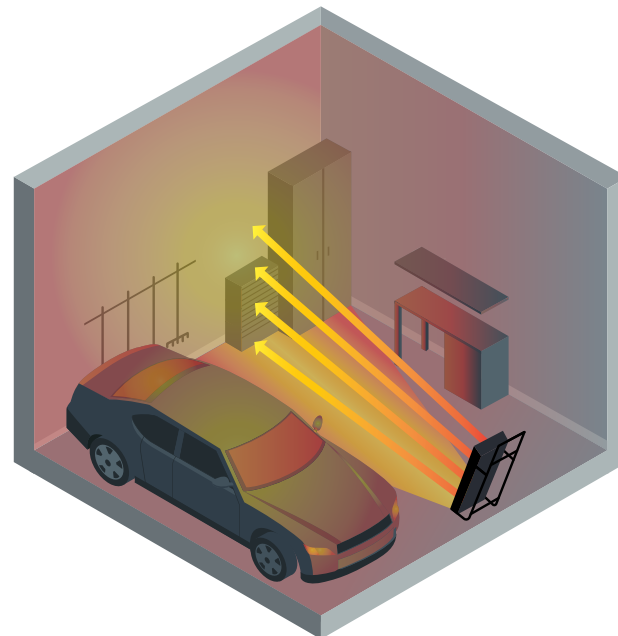

Radiant heat dispersion pattern

RADIANT HEAT FEATURES

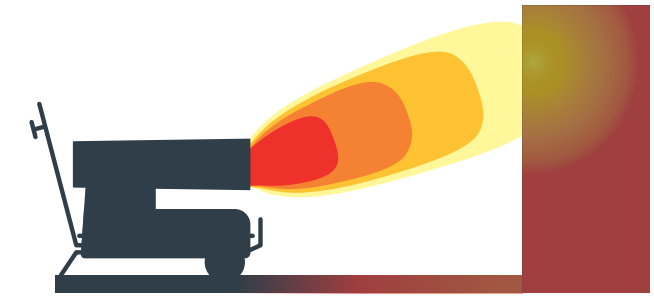

Radiant heat technology uses infrared heat energy from a radiant burner to heat people & objects placed in its path. Similar to how the sun radiates heat to objects without interference from wind.

-  **Point and heat! Heats people & objects directly in front of the heater.**
-  **Positive heat recovery. Heated objects will remain heated even when exposed to wind.**
-  **Efficient heating. Heated objects will retain heat longer than the surrounding air.**
-  **Quiet source of heat.**
-  **Available for use with a thermostat.**

Radiant heat raises the temperature of people & objects in its path.

FORCED AIR HEAT

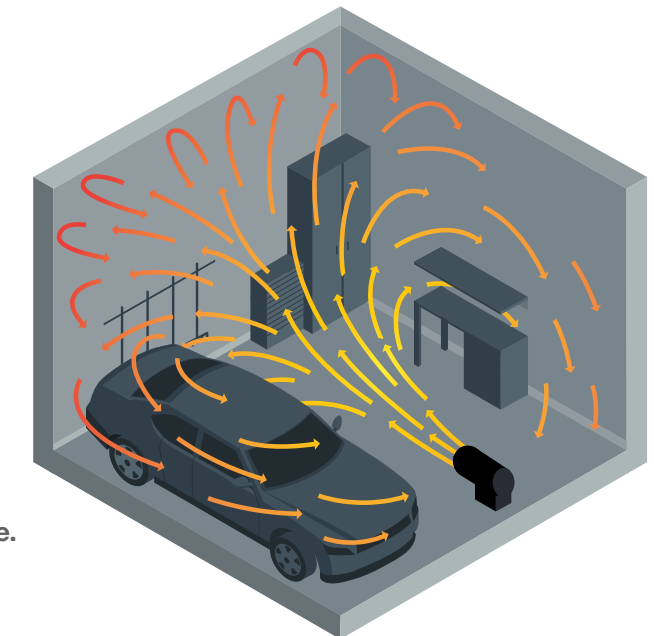

Forced air heat dispersion pattern

FORCED AIR HEAT FEATURES

Forced air or convective heat technology works by blowing heated air into an enclosed space. Forced air heat is able to quickly and efficiently heat a space. This heat can be lost quickly if cold air is introduced into the space for any prolonged period of time (e.g. repeatedly opening and closing your garage door).

-  **Heats a space quickly and efficiently.**
-  **Effectively circulates air in the space.**
-  **Quickly heats larger spaces.**
-  **Disperses heat evenly throughout a space.**
-  **Available for use with a thermostat.**

Forced air heaters circulates warm air in an area to quickly and efficiently heat a space.

BLUE FLAME *convection*

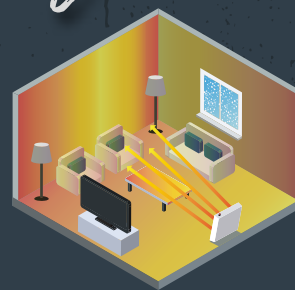

BEST FOR: INSULATED AREAS

Convection heat works by dispersing heated air, which then warms the space from the top down, much like a fireplace. Blue Flame warms the air and can be put in narrow areas.

RADIANT *infrared*

BEST FOR: DRAFTY AREAS

Radiant heat works by warming people and objects instead of the air, which in turn warms the space, much like the sun warming your face on a cold day. Infrared warms objects, which heat the air.

Not Approved for use in California or Canada. Always check local codes for permitted uses. 4,500 ft. high altitude restriction.
