

### BEFORE YOU BEGIN

**⚠ CAUTION: Risk of property damage.** Do not use plumbers putty on marble or plastic, as it may stain the surface.

- Kohler Co. reserves the right to make revisions without notice in the design of fittings, as specified in the Price Book.

### NOTES

- Shut off the main water supply.
- Observe all local plumbing codes.
- For new installations, install the drain to the lavatory before installing the lavatory.

### REQUIRED TOOLS AND MATERIALS

- Adjustable or open end wrench
- Suitable sealant
- Thread sealant

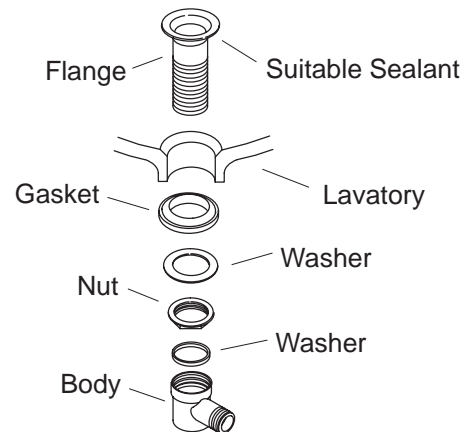

### INSTALLATION

Disassemble the drain components. Remove the protective material from the stopper and flange.

Apply a ring of suitable sealant to the underside of the flange, and insert the flange into the lavatory drain hole.

Assemble the gasket and washer to the flange, and partially thread nut to the flange. Do not tighten the nut at this time.

Install the washer and the body to the flange, and tighten securely. Do not use thread sealant.

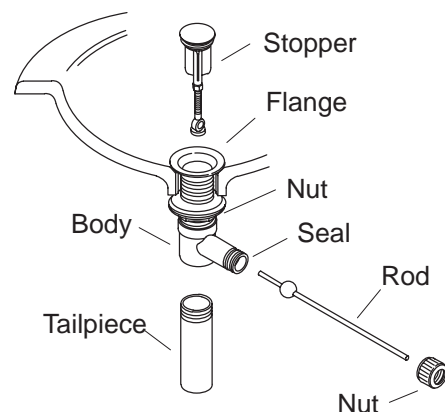

Turn the body so the seal hole is facing toward the faucet lift rod location in the rear. Carefully tighten the nut. Do not scratch the finish. Remove any excess sealant.

**NOTE:** Do not reposition the body after you have tightened the nut.

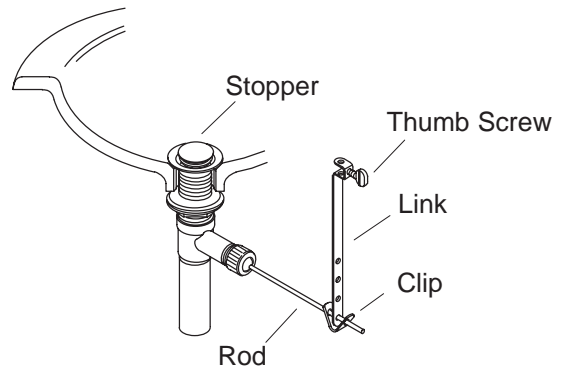

Insert the stopper into the flange. Fit the short end of the rod into the body seal hole and **under** the stopper for regular installations. Fit the rod **through** the hole in the stopper for vandal-resistant installations. Loosely secure in place with the nut. Remove and adjust the stopper so the stopper lifts about 3/8" when opened. Tighten the nut. Do not scratch the finish.

Apply thread sealant to the tailpiece. Thread the tailpiece to the body, and tighten securely.

Slide one end of the clip onto the rod. Slide the link onto the rod with the thumb screw facing the rear of the fixture. Squeeze the other end of the clip, aligning the hole with the rod. Move the link to the proper position by squeezing the clip, and sliding it along the rod.

Insert the lift rod into the hole in the spout, and then into the hole in the link. Tighten the thumb screw on the link.

For new installations, install the lavatory according to the instructions packed with the lavatory.

Install the trap.

Inspect for leaks.
